Research on instructional time: introduction

Educational theorists and researchers have long considered time a key component of individual learning. Carroll (1963), in his classic model of school-based learning, conceptualized achievement as an outcome of two time variables: first, the amount of time a learner is engaged in learning; and second, an individual's learning rate. Carroll's ideas

*Aaron Benavot (Israel)*

Senior lecturer in sociology, Hebrew University of Jerusalem. He has co-authored two books, *School Knowledge for the Masses* (with J. Meyer and D. Kamens) and *Law and the Shaping of Public Education* (with D. Tyack and T. James), as well as numerous articles in educational journals. His research, which is grounded in a macro-sociological approach to education and development, has examined historical and cross-national patterns in official school curricula, the effects of education on economic development and democratization, and the origins of mass education. Current projects focus on worldwide trends in intended instructional time and primary and secondary school curricula, and the diversification of educational knowledge in local schools.
